Abstract: Appropriate for all basic-to-intermediate level courses in Visual C# 2010 programming. Created by world-renowned programming instructors Paul and Harvey Deitel, Visual C# 2010 How to Program, Fourth Edition introduces all facets of the C# 2010 language hands-on, through hundreds of working programs. This book has been thoroughly updated to reflect the major innovations Microsoft has incorporated in Visual C# 2010 and .NET 4; all discussions and sample code have been carefully audited against the newest Visual C# language specification. Students begin by getting comfortable with the C# Express 2010 IDE and basic Visual C# syntax. Next, they build their skills one step at a time, mastering control structures, classes, objects, methods, variables, arrays, and the core techniques of object-oriented programming. With this strong foundation in place, the Deitels introduce more sophisticated techniques, including searching, sorting, data structures, generics, and collections. Throughout, the authors show students how to make the most of Microsoft's Visual Studio tools. A series of appendices provide essential programming reference material on topics ranging from number systems to the Visual Studio Debugger, UML 2 to Unicode and ASCII

Students begin by getting comfortable with the C# Express 2010 IDE and basic Visual C# syntax. Next, they build their skills one step at a time.

C# treats all real numbers you type in an application's source code (such as 7.33 and 0.0975) as double values. decimal variables store a limited range of real numbers, but are more precise and better suited for monetary amounts. To type a decimal literal, you must type the letter "M" or "m" at the end of a real number. I have downloaded Microsoft Visual C# 2010 Express to write the C# code. Now, I want to compile the code using the same visual C#. Can I? I have searched for a method to compile the code but all of the methods I founded are talking about command line 'cmd'. I tried using it but it gives me that "csc is not recognized as an internal or external command ....." although that the directory I was in is the same as the C# code directory. I want to compile and see the results in the output. This is the original code to compile.

```csharp
Your Build output says your program has compiled successfully, but to start your application, too, you need to press F5. Also, currently your program will immediately exit when done. To make it wait, add the following line at the end: Console.ReadLine() Visual C# 2012 How to Program. cscnt.savannahstate.edu. https://cscnt.savannahstate.edu/.../ Visual %20C# 2012%20How%20to%20Program .pdf.
